

Alex Metelli

Backend / Solutions Field Engineer | Developer Infrastructure | 5 Years Experience

Remote | alex-metelli@gmx.com | https://www.ametel.dev/ | github.com/ametel01

SUMMARY

Solutions-oriented backend/platform engineer with 5 years of experience turning complex technical systems into usable APIs, CLIs, SDKs, docs, and deployment workflows. Strong fit for Field Engineer / Solutions roles that need hands-on implementation, integration debugging, technical communication, and cross-functional delivery. Core stack: Rust, TypeScript, Python, Go, SQL, PostgreSQL, Cairo/Starknet, CI/CD, observability, and distributed systems.

CORE SKILLS

- Solution delivery: implementation support, API/SDK onboarding, integration debugging, troubleshooting in live/developer environments, docs, handoff, and stakeholder-facing technical explanations.
- Backend/platform: Rust, TypeScript, Python, Go, SQL, REST APIs, CLIs, SDKs, PostgreSQL/SQLite, data pipelines, Docker, GitHub Actions, CI/CD, monitoring, validation, and regression tests.
- Web3 infrastructure: Starknet/Cairo, smart-contract verification, developer tooling, indexers, wallets/payments, DeFi/game protocols, cross-chain systems, and deterministic on-chain state transitions.

EXPERIENCE

Nethermind - Software Engineer, Blockchain Infrastructure

Remote | Apr 2024 - Jun 2026

- Built Rust, TypeScript, Python, Cairo, and Solidity-adjacent infrastructure across Starknet verification, developer tools, cross-chain/ZK integrations, and protocol workflows.
- Drove core Voyager Verifier work: 27 merged PRs evolving the Rust CLI/library behind the most-used Starknet smart-contract verification software across API clients, source resolution, config/history/status/batch flows, Dojo support, docs, releases, and public library extraction.
- Integrated verification workflows into downstream tools including Starknet Foundry `sncast verify` and Dojo/Sozo, improving file gathering, payload compatibility, network selection, errors, e2e coverage, and operator-facing documentation.

NoGame - Founder & Lead Developer

2021 - 2024 | Starknet MMO / on-chain game infrastructure

- Founded and launched a space-themed Starknet MMO that reached around 300 users and generated approximately 100k Starknet transactions before being wound down due to funding constraints.
- Owned product, protocol, backend, deployment, and QA for 13 interconnected Cairo contracts covering ERC721 planets, ERC20 resources, upgrades, research, fleets, colonies, combat, loot, debris, and deterministic settlement.
- Designed rules, simulations, and deployment/test tooling so users could operate planets, manage resources, send missions, preview battles, and verify outcomes from on-chain state.

OPEN SOURCE IMPACT

Starknet verification ecosystem - Voyager Verifier / Starknet Foundry

27 merged Voyager PRs + 7 merged Starknet Foundry PRs

- Built contract-verification flows used by Starknet developers: CLI UX, API payloads, file/source collection, class-hash checks, batch/status/history flows, release automation, docs, and reusable library APIs.

Developer infrastructure contributions - Supabase CLI / Apache DataFusion

TypeScript, Go, and Rust OSS

- Merged Supabase CLI work for isolated local state and machine-readable `supabase start --output json`; merged Apache DataFusion Rust contributions for SQL diagnostics, UDF examples/docs, and SQL planner/unparser stack-safety hardening.

Blockchain/data infrastructure - Dojo Engine / Apibara DNA

10 merged Dojo PRs + 3 merged Apibara DNA PRs

- Contributed Cairo ERC20/ERC721 modules, GDA/VRGDA and constant-product market primitives, Sozo Voyager verification support, Starknet devnet integration, and PostgreSQL sink behavior for indexing pipelines.

PUBLISHED PACKAGES

- AI/developer tooling npm CLIs: skills-doctor, ritualai, claw-browser-automation, install-aztec-skills - validation, workflow extraction, browser automation, and agent-skill installation.
- Blockchain/payment SDKs: x402-starknet, voyager-x402-sdk, cairo-fp - Starknet x402 payments, payment-protected APIs, and Cairo fixed-point math.
- Aztec/Rust ecosystem: aztec-rs plus 10 supporting crates for core types, RPC/PXE/node clients, accounts, contracts, crypto, fees, wallet, and Ethereum integration; plus eth-rlp-verify and starknet-contract-verifier.
